🧠 Your Updated Tech Stack

```
iOS App (Swift)
      ↓
Node Backend (API)
      ↓
Supabase (DB + Auth)
```

🔷 1. Frontend (iOS App)

👉 Tech:

- Swift
- SwiftUI (recommended)

🎯 What it does:

- Builds the iPhone app UI
- Handles user interactions
- Calls backend APIs
- Displays calendar + events

🧩 In your app:

- Calendar screen
- Event creation screen
- Invite collaborators UI

🔌 How it communicates:

- Uses HTTP requests → your backend

Example:

```
let url = URL(string: "https://api.yourapp.com/events")
```

🔷 2. Backend (API + Logic)

👉 Tech:

- Node.js
- Express (most likely)

🎯 What it does:

- Handles all API requests
- Applies business logic
- Checks roles (admin/collaborator)
- Talks to Supabase

🧩 In your app:

- Create calendar
- Invite users
- Create/update events

👉 This is still your **core brain**

🔷 3. Database + Auth

👉 Tech:

- Supabase
- Built on PostgreSQL

🎯 What it does:

🗄️ Database:

- Stores:
  - users
  - calendars
  - events
  - collaborators

🔐 Authentication:

- Email/password login
- JWT tokens
- Session management

🔒 Security:

- RLS policies

🔷 4. API Communication (Swift ↔ Backend)

👉 Tech:

- REST APIs
- URLSession (Swift)

Example:

```
var request = URLRequest(url: url)
request.httpMethod = "POST"
request.addValue("Bearer \(token)", forHTTPHeaderField:
"Authorization")
```

👉 Token comes from Supabase Auth

🔷 5. Version Control

👉 Tech:

- GitHub

🎯 What it does:

- Share code
- Manage branches
- Collaborate

🔷 6. Environment / Secrets

Backend:

- `.env` for:
  - Supabase keys

iOS:

- Store API base URL securely
